Introduction

Primates, the order that contains our closest biological relatives, are among the best studied mammals. They offer critical insights into human evolution, biology, behavior, and emerging infectious diseases, are important components of the cultures and religions of many societies, and play key roles in ecosystem functioning (Estrada et al. 2017). Non-human primates can also shape the structure of plant communities through the dispersal of small and large seeds (Lambert and Garber 1998, Chapman and Russo 2006, Bufalo et al. 2016, Chaves et al. in press) and affect plant growth and productivity through their feeding on leaves, bark, and flowers (Chapman et al. 2013). Although much less studied, evidence on the role of some primates as pollinators has been provided in Africa, Madagascar and in the Neotropics (Heymann 2011). Primates are also appealing animals: ecotourism through the observation of primates can be an important source of income for local populations (Fuentes 2012) and they are often chosen as flagship species in conservation programs (Kierulff et al. 2012, Supriatna and Ario 2015).

While in the 1980's there was a consensus that there were around 160 primate species in the world, today, the most recent compilation of the IUCN/SSC Primate Specialist Group recognizes 496 species and 695 taxa (Mittermeier et al. 2013 updated online on September 30, 2014: http://www.primate-sg.org/primate_diversity_by_region/). There are 211 primate taxa in the Neotropics. Twenty-seven of them have been described since 1990, in recent years, and it is expected that more have yet to be discovered (Mittermeier and Rylands 2018 updated online on August 1st, 2017: http://www.primate-sg.org/new_species/). This marked increase in the number of Neotropical primates is mainly due to the use of molecular genetic techniques in taxonomic studies and to the increasing effort to study primates and their geographic distribution. Threats such as deforestation, habitat fragmentation, hunting, and infectious

disease outbreaks cause primate population declines (Estrada et al. 2017). For this reason, it is necessary to carry out reliable estimates of population size and species distribution to evaluate the local impact of anthropogenic activities and implement actions to mitigate more efficiently their negative effects (Rylands et al. 2008).

Globally, it is estimated that 55% of primate species are now threatened with extinction and 75% have declining populations (Estrada et al. 2017). In the Neotropics, 36% of the primate species are threatened and 63% have declining populations. Brazil has more primate species than any other country (Estrada et al. 2017) and 26 species, 19 of which endemic, are native to the tropical and subtropical Atlantic Forests (Graipel et al. 2017). Habitat loss and fragmentation are the main threats to primate populations of the Atlantic Forest (Chiarello 2003, da Silva et al. 2015), but poaching (Cullen Jr. et al. 2000, Canale et al. 2012, Jorge et al. 2013, Graipel et al. 2016), roadkills (Bueno et al. 2015, Ciocheti et al. 2017), and infectious diseases can also be added to the list (Almeida et al. 2012, Agostini et al. 2015, Bicca-Marques et al. 2017). The repeated outbreaks of yellow fever in Brazil (also co-occurring in Argentina and Paraguay, Almeida et al. 2012, Agostini et al. 2015) are responsible for the local extinctions of primate species in many regions. The most recent outbreak (2016-2018) has already affected more than 2000 monkeys (Bicca-Marques et al. 2017, Ministério da Saúde 2017, 2018). However, exact numbers cannot be estimated, which highlights our lack of knowledge on primate distributions and population sizes, limiting our understanding of the impacts of such events.

The Atlantic forest was one of the largest rainforests of South America, originally covering around 150 million hectares along the Brazilian coast. Today, it is reduced to only 12% of its original area and is extremely fragmented (Ribeiro et al. 2009). The Atlantic Forest is considered one of the five major conservation hotspots in the world

given its high species diversity and endemism (Myers et al. 2000). A few large areas of continuous forests still remain, in the states of São Paulo, Rio de Janeiro, and Bahia, as well as in the Misiones province of Argentina, but 80% of all forest patches are smaller than 50 ha (Ribeiro et al. 2009), limiting the long-term persistence of many primate species.

There have been many studies of primate populations and communities in the Atlantic Forest, but a large proportion of them is not published or is available only as technical reports or theses, many of them in Portuguese or Spanish. We compiled published and unpublished information with data collected between 1815 and 2017. In total, we gathered 10,649 records of 8,121 occurrence and 714 quantitative data records of primate populations and 700 communities (with one to six records per community) of 26 native and 1 introduced (*Saimiri sciureus*) primate species, as well as hybrids. These data refer to 5,152 georeferenced locations (9933 records) in the Atlantic Forest of Brazil, Argentina, and Paraguay (Figure 1) and 320 georeferenced locations (716 records) in other biomes of species native from the Atlantic Forest. The dataset ATLANTIC PRIMATES is the largest inventory of primate communities and populations for the Neotropical region.

This data-paper is part of the work of the ATLANTIC SERIES initiative the objective of which is to compile information on the biodiversity of the Atlantic Forest and make it available publicly. Until now, six data papers of this series have been published: Atlantic Frugivory (Bello et al. 2017), Atlantic Camtraps (Lima et al. 2017), Atlantic Small Mammals (Bovendorp et al. 2017), Atlantic Bats (Muylaert et al. 2017), Atlantic Birds (Hasui et al. 2018) and Atlantic Mammal Traits (Gonçalves et al. 2018).

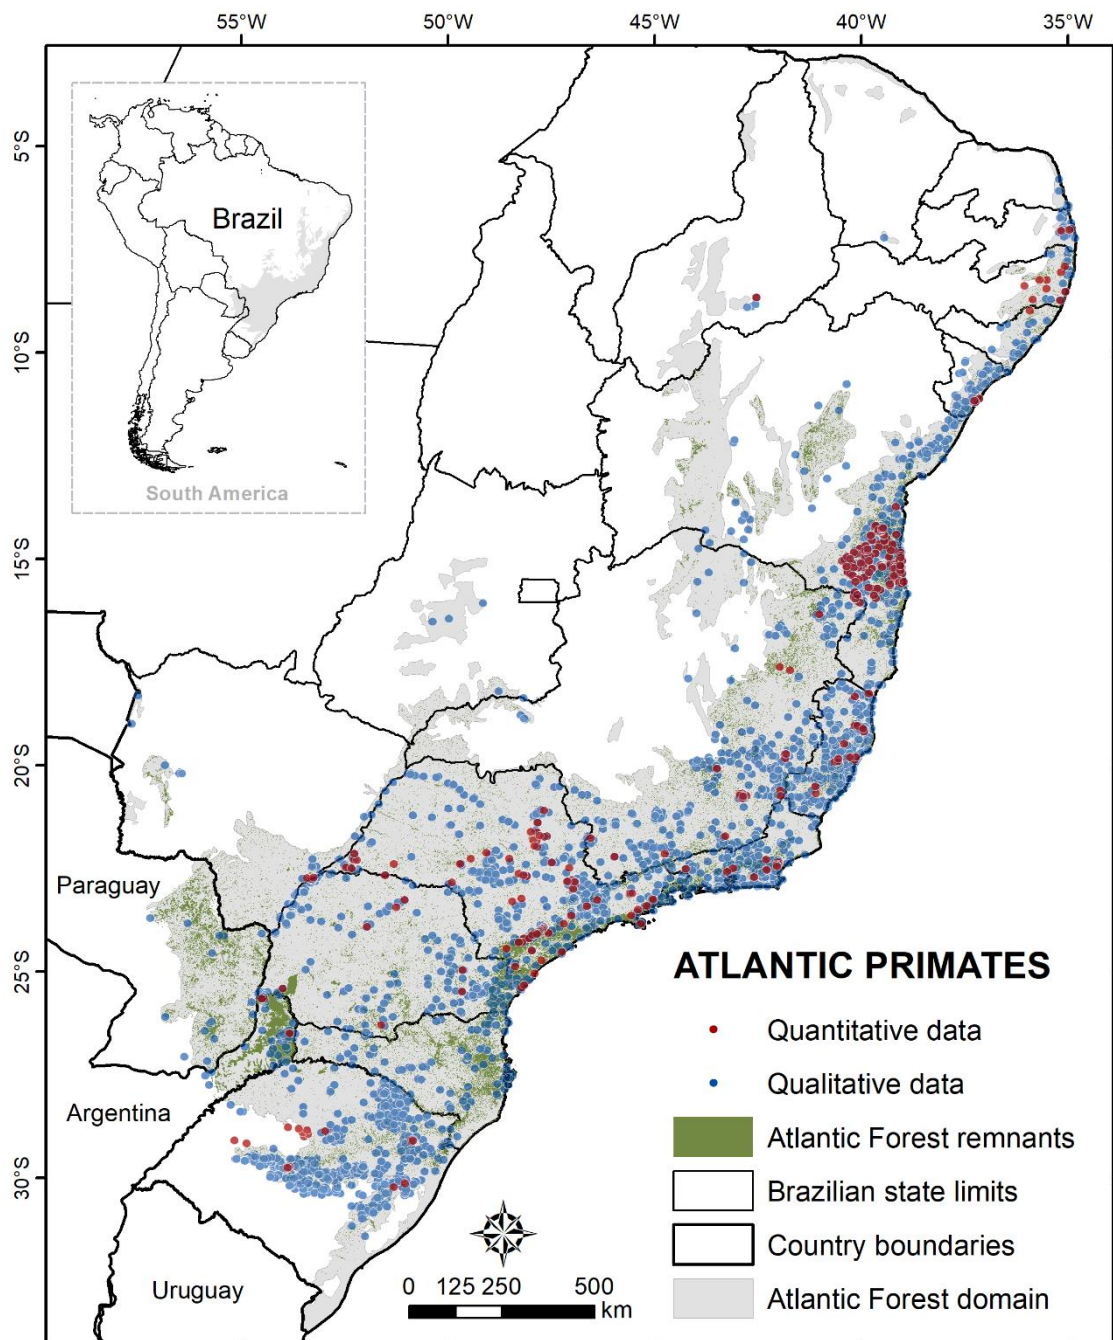

Figure 1. Distribution of the primate records of the ATLANTIC-PRIMATES dataset in the Atlantic Forest. Records are from 1815 to 2017; several populations may thus be extinct today. The gray colors show the domain of the Atlantic Forest and the green colors show the remaining Atlantic Forest patches (Ribeiro et al. 2009). Blue dots represent qualitative data of primate records (presence data only) and red dots represent quantitative data of primate records, i.e. with an estimation of abundance and/or density.

Abstract: Primates play an important role in ecosystem functioning and offer critical insights into human evolution, biology, behavior, and emerging infectious diseases. There are 26 primate species in the Atlantic Forests of South America, 19 of them endemic. We compiled a dataset of 5,472 georeferenced locations of 26 native and 1 introduced primate species, as hybrids in the genera *Callithrix* and *Alouatta*. The dataset includes 700 primate communities, 8,121 single species occurrences and 714 estimates of primate population sizes, covering most natural forest types of the tropical and subtropical Atlantic Forest of Brazil, Paraguay and Argentina and some other biomes. On average, primate communities of the Atlantic Forest harbor 2 ± 1 species (range=1-6). However, about 40% of primate communities contain only one species. *Alouatta guariba* (N=2,188 records) and *Sapajus nigritus* (N=1,127) were the species with the most records. *Callicebus barbarabrownae* (N=35), *Leontopithecus caissara* (N=38), and *Sapajus libidinosus* (N=41) were the species with the least records. Recorded primate densities varied from 0.004 individuals/km² (*Alouatta guariba* at Fragmento do Bugre, Paraná, Brazil) to 400 individuals/km² (*Alouatta caraya* in Santiago, Rio Grande do Sul, Brazil). Our dataset reflects disparity between the numerous primate census conducted in the Atlantic Forest,

in contrast to the scarcity of estimates of population sizes and densities. With these data, researchers can develop different macroecological and regional level studies, focusing on communities, populations, species co-occurrence and distribution patterns. Moreover, the data can also be used to assess the consequences of fragmentation, defaunation, and disease outbreaks on different ecological processes, such as trophic cascades, species invasion or extinction, and community dynamics.

D. Key words: biodiversity hotspot, forest fragmentation, Atelidae, Callitrichidae, Cebidae, Pitheciidae, macroecology, defaunation.

Description

The dataset comprises 10,649 independent historical and current records (from 1815 to 2017), of which 9,933 in Atlantic Forest and 716 in other biomes. All the numbers given below consider only the records in the Atlantic Forest (cf. “inside the 20km polygon” in the dataset). The records of the Atlantic Forest include most forest types of the Atlantic Forest domain (Dense Ombrophilous, Open Ombrophilous and Mixed Ombrophilous forest; Semideciduous and Deciduous forest; Altitude fields and Pioneer formations) in Brazil, Paraguay and Argentina (Ribeiro et al. 2009, Morrone 2014) as well as records in urban fragments, cabruças (cacao plantations shaded by native and exotic tree species), and plantations of *Eucalyptus* spp. and *Pinus* spp. (Figure 1). Most of the records were in Ombrophilous (29%) and Semideciduous (49%) forests, which are the dominant vegetation types of Atlantic Forest (Ribeiro et al. 2009). About 71% of the records come from peer-reviewed articles or other published material such as theses and technical reports, and 29% come from unpublished data from the authors.

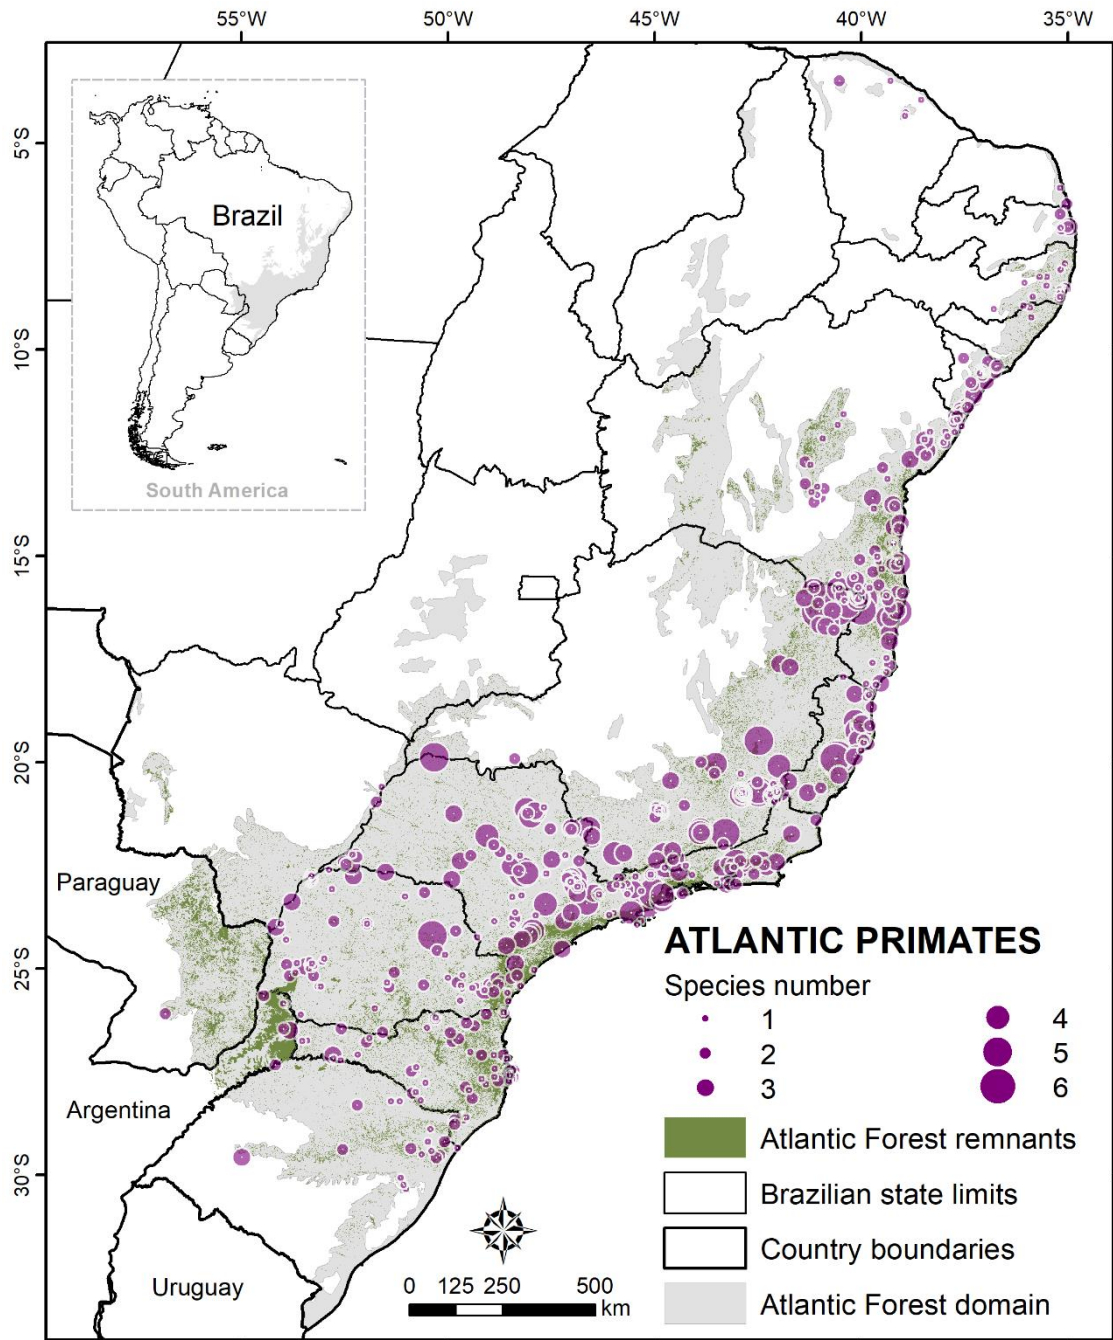

Figure 2. Distribution of the records of primate communities of the ATLANTIC-PRIMATES dataset in the Atlantic Forest. Records are from 1983 to 2017; several populations may thus be extinct today. Each colored dot indicates a primate community of 1 to 6 species. The gray colors show the domain of the Atlantic Forest and the green colors show the remaining Atlantic Forest patches (Ribeiro et al. 2009).

The Atlantic Forest records are divided into three sets of raw data: communities (N=2,037 records, quantitative or not, from 681 communities) (Figure 2), occurrences (N=7,442,

not quantitative), and quantitative data (N=700) (Figure 1). Quantitative data from studies aiming to sample primate communities were repeated in the community dataset so that the user can easily reconstitute the community from a single table.

Our dataset includes location records of 26 native species belonging to six genera (Figures 3 to 8), as well as one exotic species from the Amazonia, *Saimiri sciureus* (Table 1). We gathered 891 records for Critically Endangered species, 2,144 for Endangered species, 1,013 for Vulnerable species and 1,845 for Near Threatened species. We also gathered 186 records of species out of their presumed original distribution ranges (*Callithrix penicillata*, *C. jacchus*, and *S. sciureus*) or that were introduced within the original distribution range but from where it has been extirpated, such as *Leontopithecus chrysopygus* (cf. “allochtone” in the dataset). Finally, we compiled 30 records of hybrids, from the *Callithrix* and *Alouatta* genus. Although the dataset results from the effort to gather a maximum of current, and to a lesser extent, historical occurrence localities of the Atlantic Forest primates, it cannot be considered as an exhaustive list of primate records.

The species with the most records of our dataset were *Alouatta guariba* (N=2,188 records) and *Sapajus nigritus* (N=1,127), the two species with the largest distributions in the Atlantic Forest. The species with the fewest records were *Callicebus barbarabrownae* (N=35), *Leontopithecus caissara* (N=38), and *Sapajus libidinosus* (N=41) (Figure 9). The low number of records results from the restricted distribution of these species. On average, primate communities of the Atlantic Forest were composed of 2 ± 1 species (median=2, range=1-6). About 40% of primate communities contain only one species and only seven communities contain six species (Figures 2 and 10).

Only 7% (700/9,933) of records present quantitative data, which means that the abundances or densities of primate populations were estimated in few areas. Most of population estimates (36%) were obtained through line transect method (see Buckland et

al. 2010), with a sampling effort varying from 1.6 km to more than 618 km or surveys (12%), with sampling effort varying from 8.8 h to 32.3 h. Primate densities vary from 0.004 individuals / km² (*Alouatta guariba* in Fragmento do Bugre, Paraná, Brazil) 400 individuals/km² (*Alouatta caraya* in Santiago, Rio Grande do Sul, Brazil).

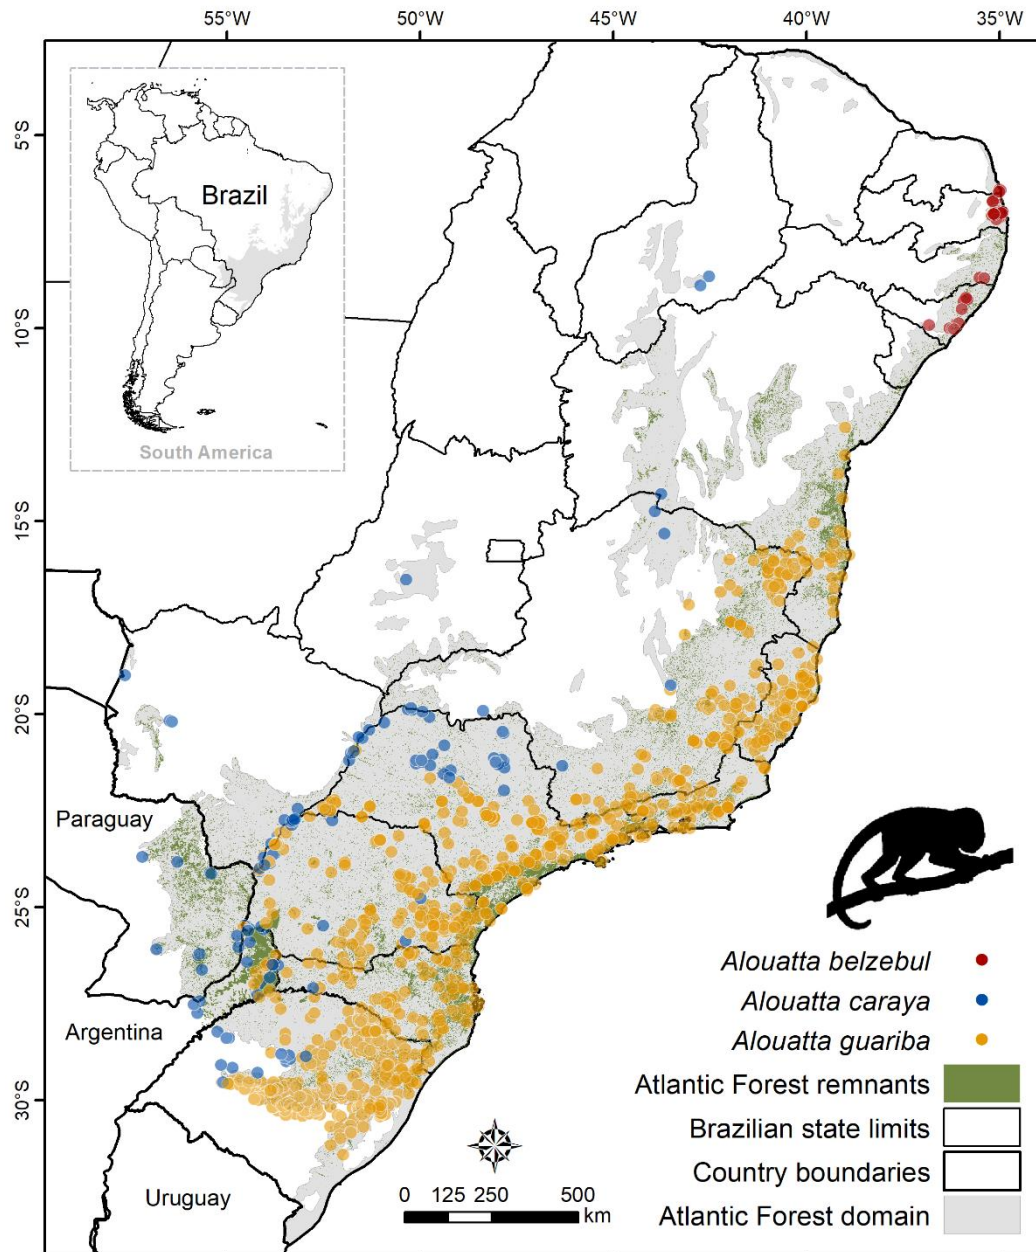

Figure 3. Distribution of the records of the genera *Alouatta* of the ATLANTIC-PRIMATES dataset in the Atlantic Forest. Records are from 1817 to 2017; several populations may thus be extinct today. The gray colors show the domain of the Atlantic Forest and the green colors show the remaining Atlantic Forest patches (Ribeiro et al. 2009). Hybrids and species registered as *Alouatta* sp. are not represented.

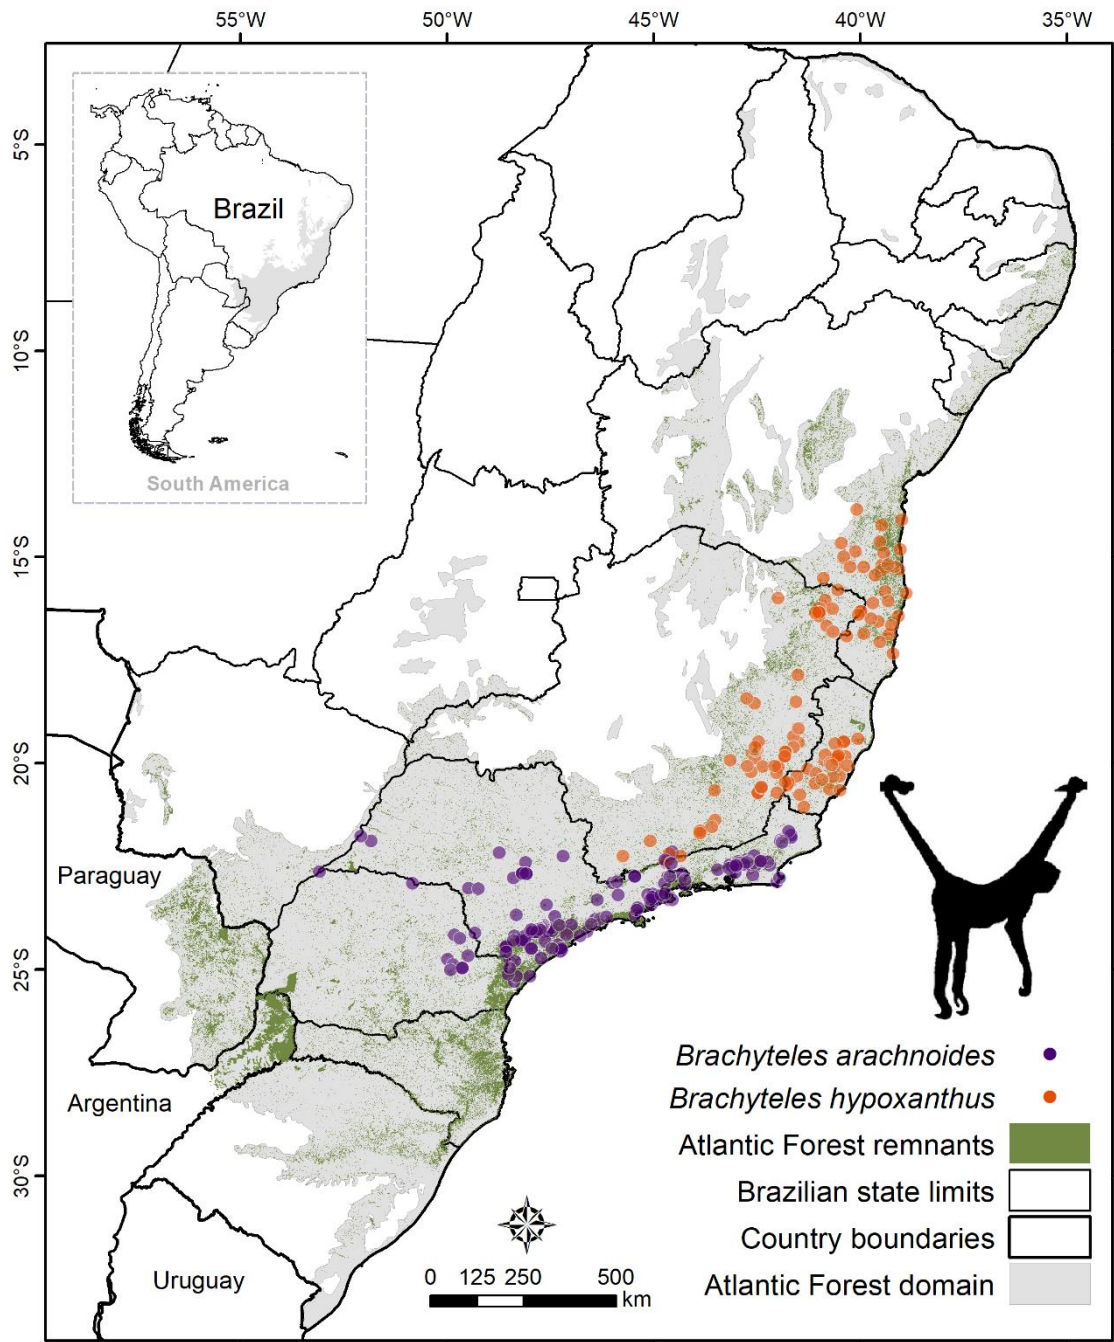

Figure 4. Distribution of the records of the genera *Brachyteles* of the ATLANTIC-PRIMATES dataset in the Atlantic Forest. Records are from 1815 to 2017; several populations may thus be extinct today. The gray colors show the domain of the Atlantic Forest and the green colors show the remaining Atlantic Forest patches (Ribeiro et al. 2009).

Figure 5. Distribution of the records of the genera *Sapajus* of the ATLANTIC-PRIMATES dataset in the Atlantic Forest. Records are from 1817 to 2017; several populations may thus be extinct today. The gray colors show the domain of the Atlantic Forest and the green colors show the remaining Atlantic Forest patches (Ribeiro et al. 2009). Species registered as *Sapajus* sp. are not represented.

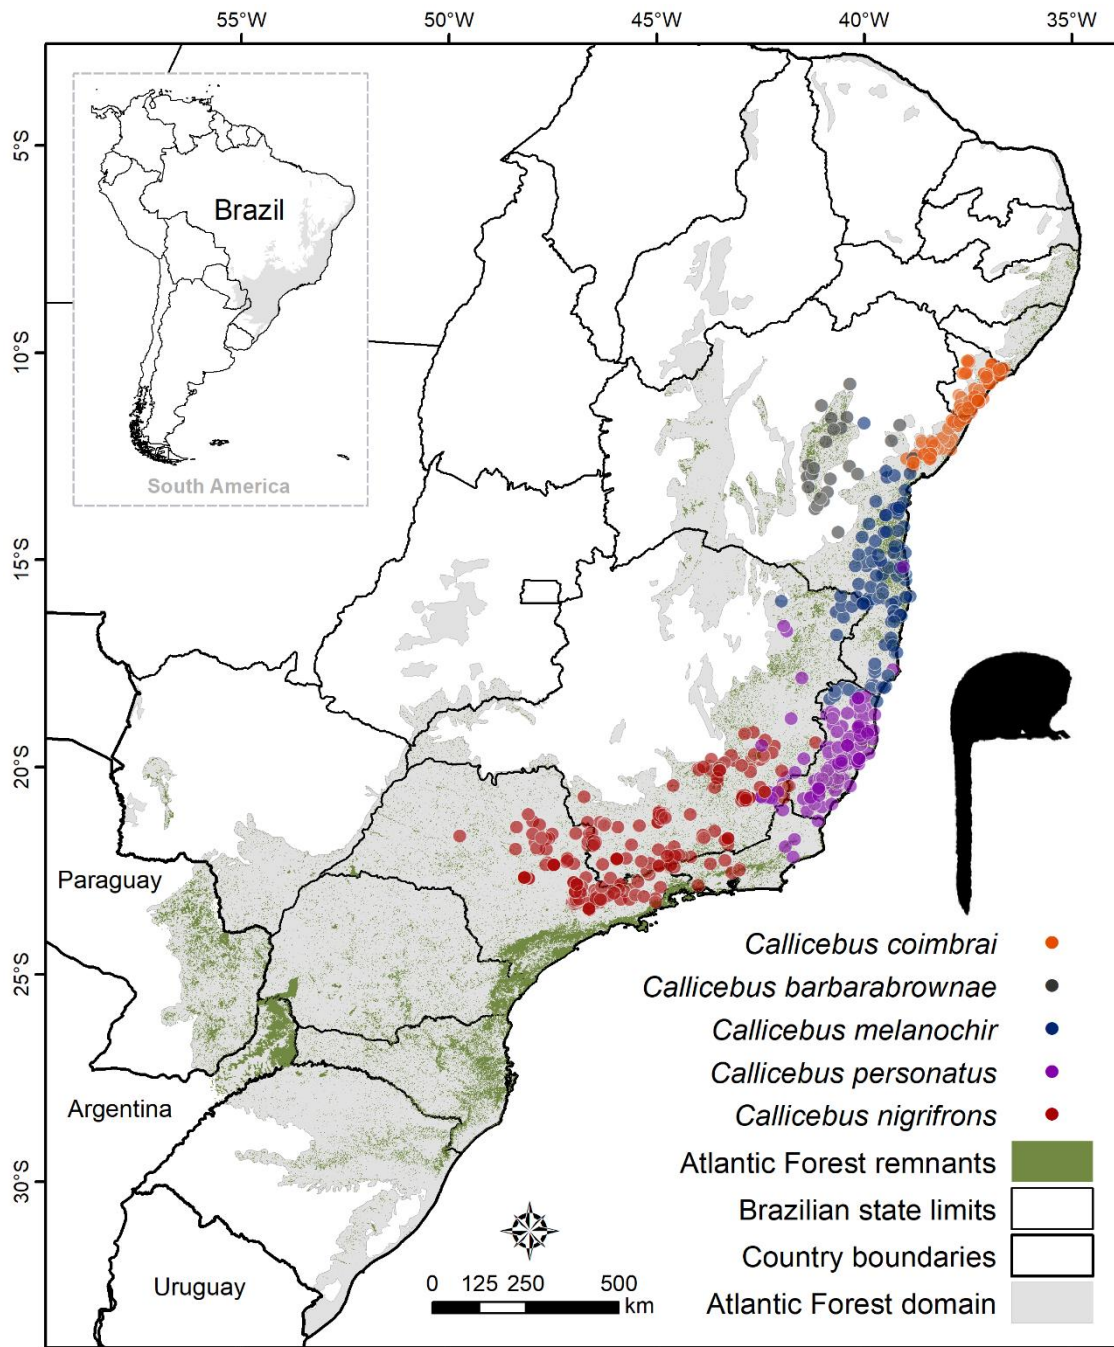

Figure 6. Distribution of the records of the genera *Callicebus* of the ATLANTIC-PRIMATES dataset in the Atlantic Forest. Records are from 1820 to 2017; several populations may thus be extinct today. The gray colors show the domain of the Atlantic Forest and the green colors show the remaining Atlantic Forest patches (Ribeiro et al. 2009). Species registered as *Callicebus* sp. are not represented.

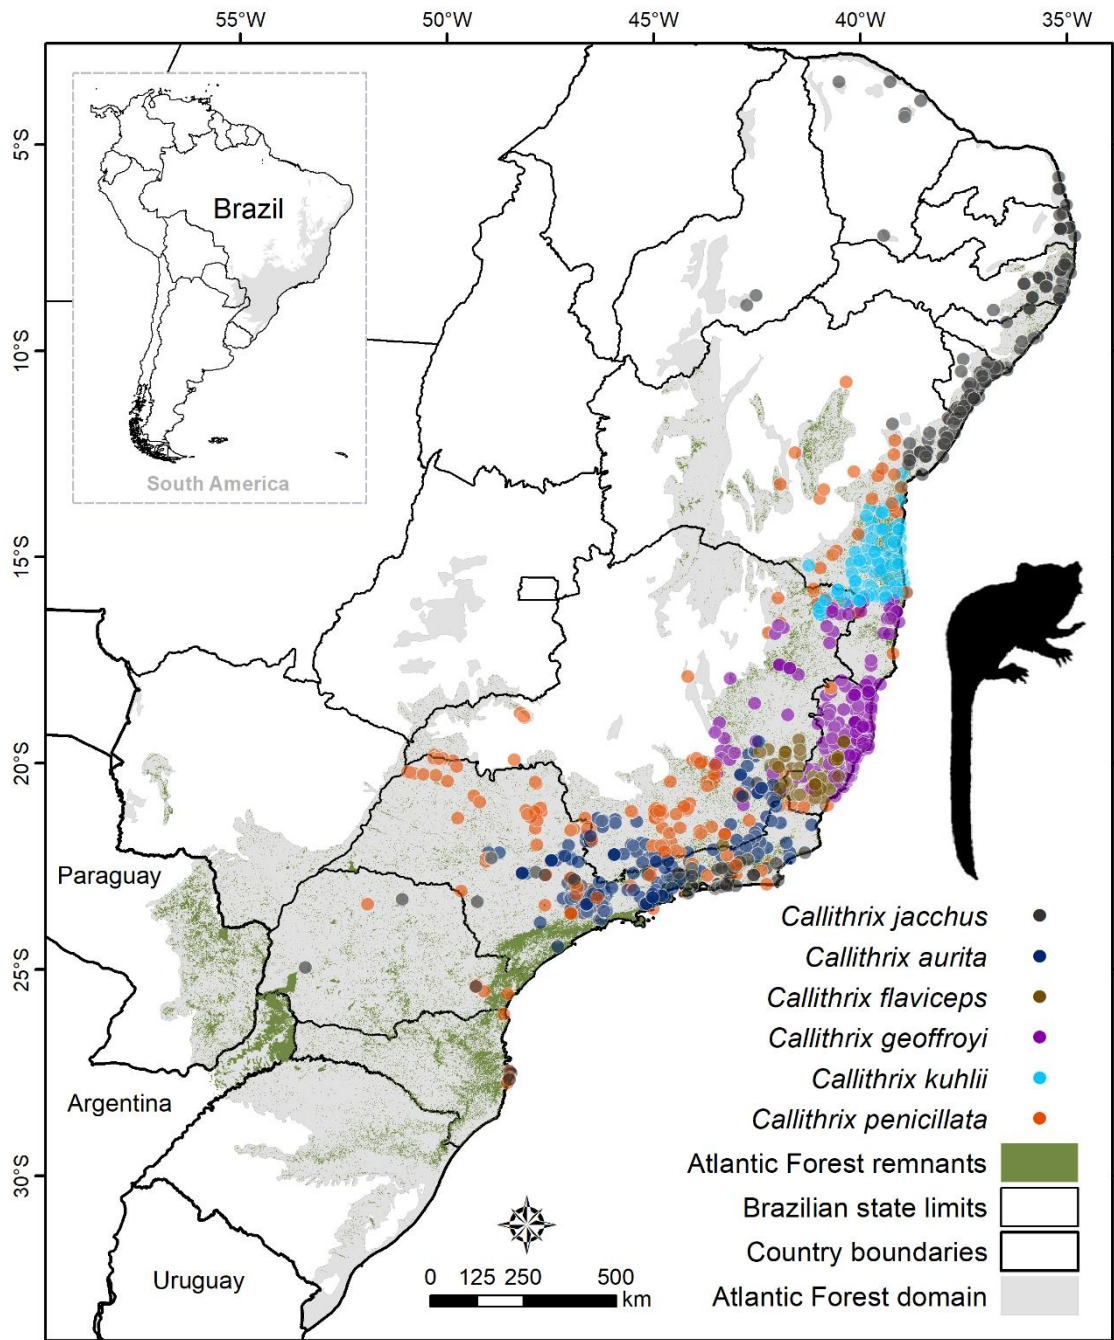

Figure 7. Distribution of the records of the genera *Callithrix* of the ATLANTIC-PRIMATES dataset in the Atlantic Forest. Records are from 1815 to 2017; several populations may thus be extinct today. The gray colors show the domain of the Atlantic Forest and the green colors show the remaining Atlantic Forest patches (Ribeiro et al. 2009). Hybrids and species registered as *Callithrix* sp. are not represented.

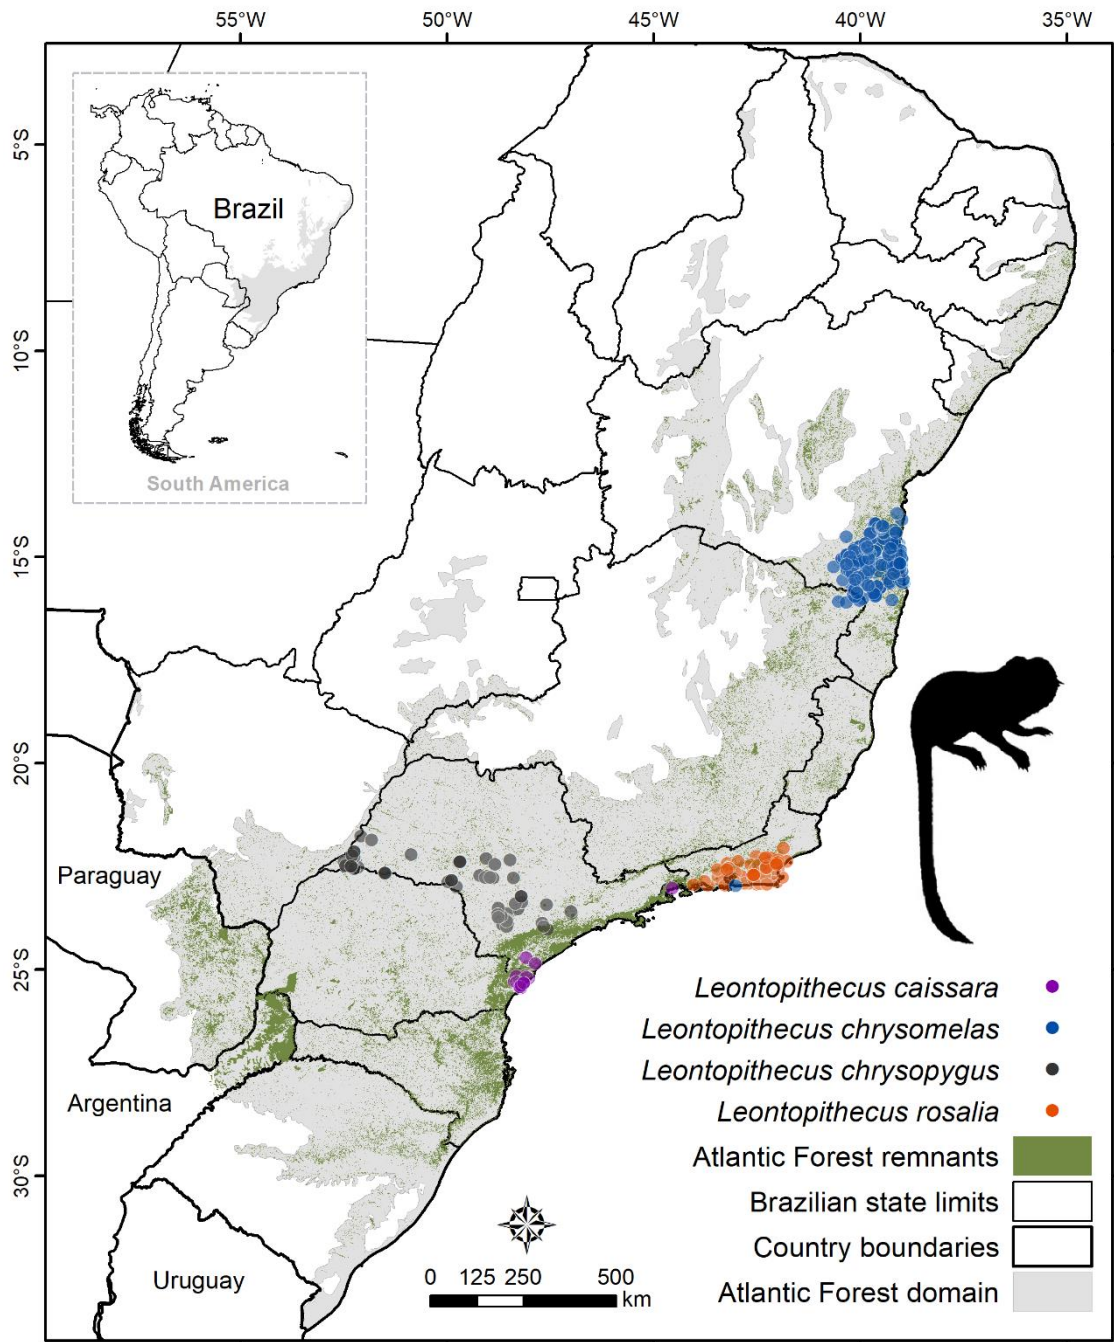

Figure 8. Distribution of the records of the genera *Leontopithecus* of the ATLANTIC-PRIMATES dataset in the Atlantic Forest. Records are from 1815 to 2017; several populations may thus be extinct today. The gray colors show the domain of the Atlantic Forest and the green colors show the remaining Atlantic Forest patches (Ribeiro et al. 2009).

Figure 9. Percentages of records of each primate species of the ATLANTIC-PRIMATES dataset. Species without confirmed identification (sp.) and hybrids are not represented. Colors refer to primate families. IUCN Conservation status is indicated as CR= Critically endangered, EN=Endangered, LC= Least Concern, NT= Near Threatened, VU=Vulnerable

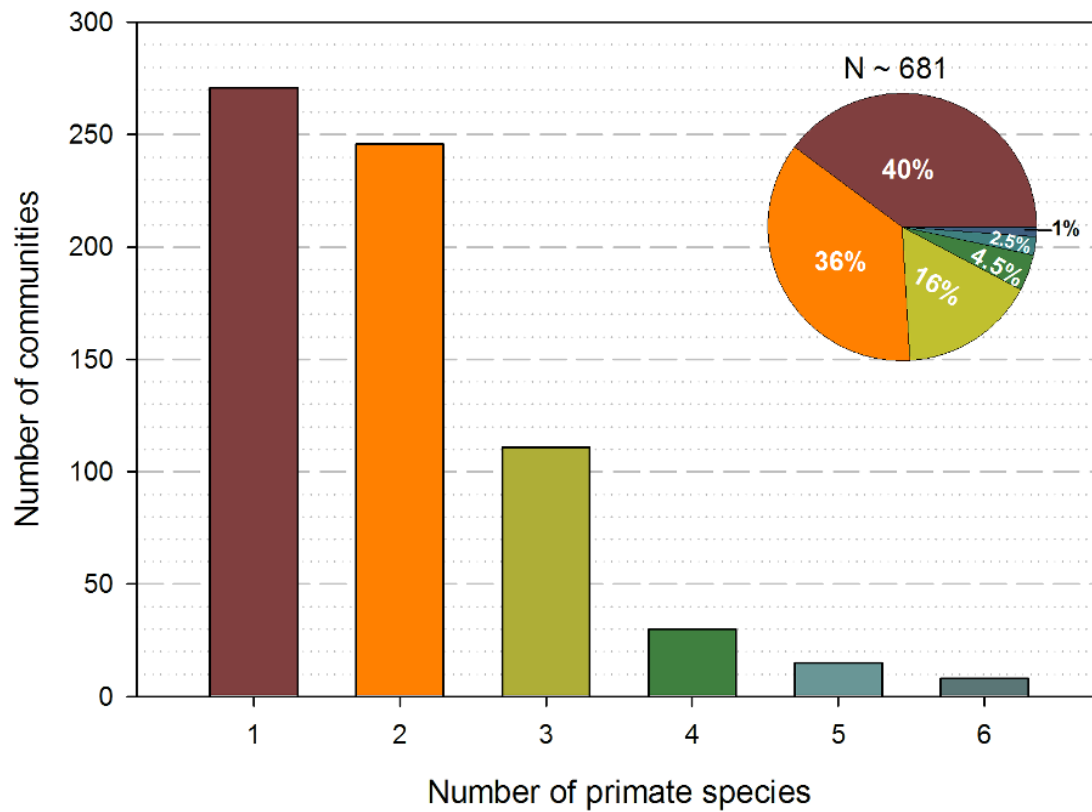

Figure 10. Species richness of primate communities in the Atlantic Forest.

CLASS II. RESEARCH ORIGIN DESCRIPTORS

A. Overall project description

Identity: A compilation of records of primate occurrence and community composition in the Atlantic Forest of Brazil, Argentina and Paraguay.

Period of Study: Dates of source publications range from 1820–2017 (data collection from 1815 to 2017).

Objectives: Our objectives were: (1) to make unpublished data of primate occurrences and communities publicly available, together with published data available in the literature in Portuguese, Spanish, and English, (2) to summarize information about the distribution of the primate species of the Atlantic Forest, and (3) to allow the identification of gaps in primate studies in the Atlantic Forest to guide future sampling efforts. Our dataset is the first attempt to produce a large-scale primate inventory, with potential applications in macroecological studies, population and community ecology research, and establishment of conservation strategies.

Abstract: Same as above.

Sources of funding: The compilation of this dataset was supported by grants and scholarships from the Fundação de Amparo à Pesquisa do Estado de São Paulo (São Paulo Research Foundation; FAPESP) numbers 2014/14739-0 (LC), 2017/08440-0 (LAP), 2017/07954-0 (LFF), 2013/50421-2 (MCR) and 2014/01986-0 (MG) and by the Conselho Nacional de Desenvolvimento Científico e Tecnológico (Brazilian Research Council, CNPq) numbers 141813/2017-2 (AS). MG, MCR (process #312045/2013-1; #312292/2016-3), and AGC receive research grants and fellowships from CNPq. The studies compiled in our dataset were funded by grants, scholarships and fellowships given by CNPq (RCA, AGC, JCBM -303154/2009-8 and 303306/2013-0, CRB, RBM-503372/2014-5 and 150123/2018-3, SFF), Conservation Leadership Programme (RCA), Fundação Grupo Boticário de Proteção à Natureza (number 1037_20151, WPM, CRB, FdOG, JSR and TCM-0939-20121, SFF), FACEPE (JPSA BCT- 0025.2.05/17), The Rufford Foundation (number 1966-1, ASF, JSR and TCM - 11495-1), Idea Wild (ASF, IA, MSDB, IH, MNBdR, RH, JSR, TCM), Comissão de Aperfeiçoamento Profissional

.

B. Specific subproject description

Site description: The Atlantic Forest was one of the largest rainforests in the world. It encompasses tropical and subtropical evergreen and semideciduous forests lying within the eastern coast of Brazil and small areas in northeastern Argentina and southeastern Paraguay (Morellato and Haddad 2000). As an important biodiversity hotspot in South America (Willis et al. 2007), the Atlantic Forest ecosystem supports up to 8% of all species in the world and presents one of the highest rates of endemism (Myers et al. 2000). The Atlantic Forest harbors 15,519 plant species (3,343 trees) (Zappi et al. 2015), 350 fishes (MMA 2010), 543 amphibians (Haddad et al. 2013), 200 reptiles (Bérnils and Costa 2015), 891 birds (Moreira-Lima 2014), and 321 mammals (Graipel et al. 2017). Nineteen (73%) of its 26 primate species are endemic to this forest (Graipel et al. 2017).

Currently, the Atlantic Forest covers <12% of its original area. More than 80% of its remnants are small fragments (<50 ha) (Ribeiro et al. 2009). Seventy-two percent of the Brazilian human population (~145 million people) lives within the Atlantic Forest domain (IBGE 2013), and the industrialization, agricultural and unplanned urban expansions are

the main causes of landscape fragmentation and ecosystem deterioration (Scarano and Ceotto 2015). The negative effects of anthropogenic impacts, including poaching, extirpated the large mammals - including primates - from 88% of Atlantic Forest fragments (Galetti et al. 2009, Jorge et al. 2013). The immediate conservation of the Atlantic Forest is critically urgent to stop ongoing local extinctions of primates and other large mammals.

Data compilation: We did an extensive literature search on Google Scholar to find published documents that report the geographic location of primate communities and populations in the Atlantic Forest using the following combination of keywords in English: “primates”, “communities”, “Atlantic Forest”, “survey”, “occurrence”; and their equivalent in Portuguese. We did not restrict the search to checklist papers such as papers related to species geographic distribution, distribution summaries or list of species. In the same way, we did not limit our search to specific years of publication or methods. Here, we compiled 654 papers and 41 book chapters published between 1820 to 2017. We also compiled 198 documents from the grey literature (using the same keywords as above) such as theses, dissertations, monographs, management plans, and congress abstracts. We carried out this search in online repositories of several Brazilian universities and in the database of management plans of ICMBio (Instituto Chico Mendes de Conservação da Biodiversidade), the agency that manages the federal system of protected areas in Brazil.

Simultaneously, we created a collaborative network of researchers who had unpublished data on primate occurrence and community composition in the Atlantic Forest and invited them to share their data in this dataset. In addition, we collected occurrence data in the following museums and institutions: Museu Nacional/Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil (MNRJ), Museu

572 de Zoologia da Universidade de São Paulo, São Paulo, Brazil (MZUSP), Centro de
 573 Primatologia do Rio de Janeiro, Rio de Janeiro, Brazil (CPRJ), Museu da Fauna, Rio de
 574 Janeiro, Brazil (MFRJ), Museu Paraense "Emílio Goeldi", Pará, Brazil (MPEG),
 575 Fundação Zoobotânica do Rio Grande do Sul (FZBRS), Museu de História Natural do
 576 Capão da Imbuia, Paraná, Brazil (MHNCI), Centro Universitário Barra Mansa, Rio de
 577 Janeiro, Brazil (CUBM), Pontifícia Universidade Católica do Rio Grande do Sul, Rio
 578 Grande do Sul, Brazil (PUC-RS), Universidade Federal da Paraíba (UFPB), Paraíba,
 579 Brazil, Universidade Federal do Rio Grande do Norte (UFRN), Rio Grande do Norte,
 580 Brazil, Universidade Federal de Viçosa (UFV), Minas Gerais, Brazil, Universidade de
 581 Brasília (UnB), Brasília, Brazil, Universidade Federal de Santa Catarina (UFSC), Santa
 582 Catarina, Brazil, Museu Arquidiocesano Dom Joaquim, Santa Catarina, Brazil (MADJ),

 591 Institution National Museum of Natural History, Washington, D. C. (USNM), and Kansas
 592 University Natural History Museum, Lawrence, Kansas (KUNHM).

593

594 **Research Methods:** In this dataset, we included all studies that report the geographic
 595 location of primate communities or occurrences in the Atlantic Forest, regardless of year
 596 or sampling method. We converted the coordinates of all records to decimal degrees with

datum WGS 84. Some coordinates refer to specific localities such as municipalities, roads or farms and not to the sampling areas. These records belong mainly to historical occurrences and we labeled them as “Not precise” in the “PRECISION” column.

We defined the boundaries of the Atlantic Forest using the same procedure as Muylaert et al. (2017) and Hasui et al. (2018), and described as followed. We merged available geographic information from the main boundaries that inform the extent of the Atlantic Forest: the official boundary used by the Brazilian government (IBGE 2016), the Atlantic Forest Law initiative boundary (MMA 2006), the boundary used to extract the remaining Atlantic Forest (Ribeiro et al. 2009), and the boundary provided by Olson et al. (2001), that was also used by the WWF and that is available online (<https://www.worldwildlife.org/publications/terrestrial-ecoregions-of-the-world>). We made a subset of the Atlantic Forest and Atlantic Dry Forest categories inside and outside Brazil from the terrestrial ecosystem shapefile (Olson et al. 2001). We considered the records in the Atlantic Forest when they were within a 20-km buffer around the Atlantic Forest boundaries (see the BUFFER_20km variable in the “Variable information” tables). However, we did not exclude the records from other biomes of species naturally occurring in the Atlantic Forest. We extracted spatial and geographical information available in several databases using ArcGIS 10.5 and the “Spatial join” and “Extract values to points” functions to access the data of each primate record. We used data from IBGE (2016) for municipalities and states data, USGS (2001) for altitude data, WorldClim 1.4 (Hijmans et al. 2005) for annual mean rainfall and annual mean temperature data and Ribeiro et al. (2009) for type of vegetation.

We organized the entire dataset in three sub-datasets: Quantitative information, Community information and Occurrence information. Quantitative information (Table 3) contains all quantitative population data, such as abundance (individuals/10 km) and

density (individuals/km² or individuals/ha), obtained mainly by the linear transect method. Community information (Table 4) contains all records of natural communities in the Atlantic Forest, with or without quantitative data. When a species recorded in a community contains quantitative information, we included it, as well, in the quantitative dataset. The community dataset includes information recorded independently with several sampling methods (camera trap, interview, line transect, survey, playback, visualization, spontaneous vocalization) or combinations of them. Occurrence information (Table 5) contains all individual and occasional records of primate species without quantitative information. This occurrence dataset was also based on several sampling methods (camera trap, interview, line transect, museum, playback, road kill, survey, visualization, spontaneous vocalization) or a combination of them. When several records were available for a same study site (but from different years and/or different authors), we let them all in the datasets to enable temporal analysis. In addition, these records sometimes come from different places of a same study site, hence allowing the comparison of primate abundances, occurrences and/or communities. Missing information was labeled as “NA” in the dataset.

The following literature was used to compile the records:

Krieg 1948, Coimbra-Filho 1970, 1976, Milton 1984, Stallings et al. 1990, Silva and da Cruz 1993, Antonietto and Mendes 1994, Martuscelli et al. 1994, Valladares-Pádua and Cullen Jr 1994, Oliveira and Manzatti 1996, Fontes et al. 1996, Hill et al. 1997, Vieira and Mendes 1999, Chiarello 1999, 2000, Martins and Setz 2000, Cullen et al. 2000, Passos and Alho 2001, Simas et al. 2001, Grativol et al. 2001, Guimarães and Strier 2001, Keuroghlian and Passos 2001, Price et al. 2002, Vilela and Faria 2002, Buss and Romanowski 2002, Codenotti et al. 2002, de Souza et al. 2002, Hirsch et al. 2002b, Koehler et al. 2002, Kowalewski et al. 2002, Gheler-Costa et al. 2002, ICMBio 2002,

Taxonomic data: We used the taxonomy proscribed by Mittermeier et al. (2013). Therefore, we changed the identity of some primate species to the most recent nomenclature.

Validation: Specialists checked the localities recorded for each primate species and excluded the points that were erroneous. Due to changes in nomenclature, several records of *Sapajus robustus* in Minas Gerais were registered as *Sapajus nigritus*. In addition, further surveys confirmed the occurrence of *Sapajus robustus* in that region. We thus corrected these data following Martins et al. (2017).

C. Data Limitations and Potential Enhancements

Although primates are one of the best studied mammal orders, assessing the fine-scale distribution of each species and estimating their population sizes in the Atlantic Forest is an unachievable task. Therefore, we recognize the massive effort of field biologists and primatologists who collected the data compiled here, the largest dataset of primate communities and occurrences in a tropical forest biome so far amassed.

One limitation of this dataset is the relatively small number of quantitative studies in comparison with the high number of occurrence data. Line transect sampling is the preferred method to estimate primate densities (Peres 1999, Buckland et al. 2010). However, it is limited by the need of a minimum number of sightings, a number that can be difficult to reach, especially in the case of more elusive primate species or when the population density is low. For these species, the combined use of line transects and playback is a useful option that gives good results (Gestich et al. 2017) and deserves to be more extensively used.

Another issue is the uneven distribution of the sampling effort across the Atlantic Forest. For instance, three Brazilian states account for more than 50% of the records: Bahia (N=2,132, 21.5%), São Paulo (N=1,849, 18.6%), and Minas Gerais (N=1,614, 16.3%). However, they are also the biggest states in the Atlantic Forest area, which partly explains this result. It is also important to note that our dataset gathers presence-only data and not presence-absence data, which needs to be considered by the user when analyzing the data.

The occurrence of *Callithrix* hybrids of unknown parentage is another limitation of the dataset. We kept the records as *Callithrix* sp. with the observation “hybrid” in the species origin column.

Another important limitation is the low geographical accuracy reported by some studies. For instance, some coordinates refer to cities instead of to the sampled fragments. We tried to correct these coordinates using satellite images or directly contacted the authors. Otherwise, we kept the original coordinates as provided.

Study duration also varied widely, ranging from days to years. Additionally, the data collection of some longer-lasting studies was heterogeneously distributed in time with irregular inter-sample intervals.

It is known that ongoing habitat loss and fragmentation (Chiarello 2000), poaching (Galetti et al. 2009), road kills (Bueno et al. 2015), and infectious diseases (Bicca-Marques and Freitas 2010) influence the presence and size of primate populations in fragments (Chiarello 2003, da Silva et al. 2015). Therefore, the pattern of occurrence of a species at any given landscape reflects a dynamic balance of population extirpation and recolonization that is influenced by the aforementioned factors and others. The ongoing (2016-current as of February 2018) outbreak of sylvatic yellow fever in Brazil is an unambiguous example of the rapid local population extirpation or shrinking that an infectious disease can cause in a fragmented landscape such as the Atlantic Forest (Bicca-Marques et al. 2017). In addition, attention must be paid to the dates of records, ranging from 1815 to 2017. We did not determine, for each record, if the mentioned population still exists or not, since this analysis would go well beyond our objectives. However, we indicated that the population was extinct when this information was specifically provided by the authors.

Despite these limitations, this dataset is the largest and broadest that exists on the distribution of Atlantic Forest primates. We expect that the users of this dataset will be able to: 1) detect patterns of species distribution; 2) determine priority areas for primate conservation; 3) point out temporal and spatial variation of populations; 4) identify the

896 species with the highest need of study; 5) indicate localities or regions requiring more
897 sampling, and 6) fulfill many other conservation-related knowledge gaps.

898

899 **CLASS III. DATA SET STATUS AND ACCESSIBILITY**

900 **A. Status**

901 **Latest update:** August 2018

902 **Latest Archive date:** August 2018

903 **Metadata status:** Last update 19 August 2018, version submitted

904 **Data verification:** Data from published and unpublished sources. We searched for
905 extreme values, corrected any transcription errors and homogenized the taxonomic
906 information.

907

908 **B. Accessibility**

909 **1. Storage location and medium**

910 The dataset can be access on the GitHub Inc. repository
911 (https://github.com/LEEClab/Atlantic_series) in .csv format.

912 **2. Contact persons:** Laurence Culot, Universidade Estadual Paulista (UNESP), Instituto
913 de Biociências, Departamento de Zoologia, Rio Claro (SP), 13506-900, Brazil. E-mail:
914 lculot@rc.unesp.br; Milton C. Ribeiro, Universidade Estadual Paulista (UNESP),
915 Instituto de Biociências, Departamento de Ecologia, Rio Claro (SP), 13506-900, Brazil.
916 E-mail: miltinho.astronauta@gmail.com.

917 **Copyright restrictions:** None.

918 **Proprietary restrictions:** Please cite this data paper when the data are used in
919 publications. We also request that researchers and teachers inform us of how they are
920 using the data.

921 **Costs:** None.

922

923 **CLASS IV. DATA STRUCTURAL DESCRIPTORS**

924 **A. Data Set File**

925 **Identity:**

926 ATLANTIC-PR_References.csv,

927 ATLANTIC-PR_Quantitative.csv,

928 ATLANTIC-PR_Community.csv,

929 ATLANTIC-PR_Occurrence.csv

930 **Size:** 10649 records, 3545 KB

931 **Format and storage mode:** comma-separated values (.csv)

932 **Header information:** See column descriptions in section B.

933 **Alphanumeric attributes:** Mixed.

934 **Data Anomalies:** If no information is available for a given record, this is indicated as
935 'NA'.

936

937 **B. Variable information**

938 **1) Table 2. Reference Information**

939 **2) Table 3. Quantitative Information**

951

952 **ACKNOWLEDGMENTS**

953 This paper is part of the ATLANTIC initiative. We thank the companies that provided
954 sources: AES Tietê Energia S.A, Casa da Floresta Ambiental SS, CMA Costa, Bahia
955 Specialty Cellulose/Copener (and their staff: BF Rosa, EF de Lima, RA Nobre, LS
956 Morais, JK Felipe, MB Oliveira), Eldorado Brasil, Fibria Celulose, FJ Paula, IG Vieira,
957 Instituto de Pesquisas e Estudos Florestais, Klabin, Vale S.A, Veracel Celulose, VL
958 Camargos, SN Paiva, Suzano Papel e Celulose, TC Rech, and Y Matsuda. This paper is
959 dedicated to Adelmar Coimbra-Filho, Anthony Rylands and Russel Mittermeier for their
960 long contribution to Neotropical primatology and for inspiring and training generations
961 of young primatologists.

962

963

TABLES

Table 1. Species information. Family, IUCN conservation status and number of records of the primate species reported in the ATLANTIC PRIMATES dataset. Only the records within the 20 km buffer around the Atlantic Forest boundaries were considered here. Species without confirmed identification (sp.) and hybrids were not included in the species counting. CR= Critically Endangered, EN=Endangered, LC= Least Concern, NT= Near Threatened, VU=Vulnerable

Family	Species	IUCN Status	Number of records
Atelidae	<i>Alouatta guariba</i>	LC	2188
	<i>Alouatta caraya</i>	LC	196
	<i>Alouatta belzebul</i>	VU	90
	<i>Brachyteles arachnoides</i>	EN	293
	<i>Brachyteles hypoxanthus</i>	CR	333
Cebidae	<i>Sapajus flavius</i>	CR	42
	<i>Sapajus libidinosus</i>	LC	41
	<i>Sapajus nigritus</i>	NT	1127
	<i>Sapajus robustus</i>	EN	248
	<i>Sapajus xanthosternos</i>	CR	443
	<i>Sapajus cay</i>	LC	67
	<i>Saimiri sciureus</i>	LC	3
Pitheciidae	<i>Callicebus coimbrai</i>	EN	182
	<i>Callicebus melanochir</i>	VU	212
	<i>Callicebus nigrifrons</i>	NT	423
	<i>Callicebus personatus</i>	VU	200
	<i>Callicebus barbarabrownae</i>	CR	35
Callitrichidae	<i>Callithrix penicillata</i>	LC	440
	<i>Callithrix aurita</i>	VU	511
	<i>Callithrix flaviceps</i>	EN	219
	<i>Callithrix geoffroyi</i>	LC	522
	<i>Callithrix jacchus</i>	LC	320
	<i>Callithrix kuhlii</i>	NT	295
	<i>Leontopithecus caissara</i>	CR	38
	<i>Leontopithecus chrysomelas</i>	EN	897
	<i>Leontopithecus chrysopygus</i>	EN	96
	<i>Leontopithecus rosalia</i>	EN	209

975 **Table 2. Reference information.** Description of the fields related to references.

Type of information	Field	Description	Levels	Example
REFERENCE INFORMATION	REF_ID	Reference identification that links the references to a specific record in the dataset	REF0001 - REF0894	REF0648
	PUB_TYPE	Type of the publication: “Thesis” refer to theses, dissertations and monographs; “Technical document” refer to reports and wildlife management programs	Article Book Congress abstract Technical document Thesis Unpublished data	Book
	REFERENCE	Study reference in <i>Ecology</i> style	856 references	Rylands, A. B., Coimbra-Filho, A. F., and Mittermeier, R. A. 1993. Systematics, geographic distribution, and some notes on the conservation status of the Callitrichidae. In: Rylands, A. B. (ed.). Marmosets and tamarins: Systematics, behaviour, and ecology. Oxford University Press. 11-77.

976

977 **Table 3. Quantitative information.** Description of the fields related to primate
 978 occurrence data with quantitative information.
 979

Type of information	Field	Description	Levels	Example
QUANTITATIVE INFORMATION	REF_ID	Reference identification that links the references to a specific record in the dataset	REF0001 - REF0894, and unpublished data	REF0001
	ORDEMBD	Identification code of each species record. Each code is exclusive and represents the record in the sampling area. Records made in the same area in different studies received different codes.
